Navigation of this Document

In order to jump to results of interest, display the Table of Contents for this pdf file in the left pane of your pdf viewer. The top level of the Table of Contents contains labeled sections for each outcome, within which subsections are nested for each piece of the analysis. Clicking the items in the pane will take you to the relevant set of results.

1 Introduction

For this analysis of BPD's arrest data, we offer comprehensive results that are summarized in our main report. The basic analysis strategy is to first model the prevailing cyclical arrest trend from Monday, January 7, 2013 through Sunday August 10, 2014. Then, we use that estimated model to predict a counterfactual arrest trend, as if the protest events and any changes in police practice from August 10, 2014 onward had not occurred. We then estimate period effects as average differences between observed and counterfactual values from August 11, 2014 onward in four distinct time intervals. In the remaining subsections of this introduction, we provide details on the content that follows.

Descriptive Summary of the Data

The outcomes analyzed in subsequent sections are listed and summarized in Table 2.1 in the Data section, after which a breakdown of totals across all outcomes is provided by police district in Table 2.2. Finally, a five-panel figure displays the distribution of the five variables utilized to represent weather, hours of darkness, and school days for the full time series.

Results for Each Outcome

For each outcome, we first offer a table with coefficients from four estimated models:

- Model 1 is a naive model with four estimated coefficients for the period indicator variables for the full time series;
- Model 2 is a "pretreatment" model, estimated only for data prior to August 11, 2014, that fits coefficients for weather, hours of darkness, and school days;
- Model 3 is analogous to Model 1 but utilizes an outcome variable for the full time series that has been de-trended using coefficients for weather, hours of darkness, and school days estimated by Model 2 using data from the "pretreatment" period only;
- Model 4 is an alternative to Model 3 that fits coefficients for weather, hours of darkness, and school days simultaneously with coefficients for the four period indicator variables.

The period effects estimated for Model 3 are our preferred estimates, and the period effects estimated for Model 4 are plausible alternatives.

We then offer two figures that depict the fit of Model 2 as well as the variation that generates the period effects estimated for our preferred Model 3. For both figures, the black line is the predicted time series

from Model 2 while the red line is an extrapolated cyclical trend, generated by forming the predictions from the coefficients for Model 2 applied to the observed values for weather, hours of darkness, and school days from August 11, 2014 onward. The first figure overlays gray dots for the observed weekly total for each outcome, and the second figure substitutes a light blue line for the three-week moving average of the observed weekly totals. The differences between the gray dots (or the light blue line) and the red line is the source of variation that generates the period effects estimated for our preferred Model 3.

Finally, for each outcome a diagnostic model is also fit to assess the extent to which the least squares estimation of Model 2 adequately represents the underlying time series up through August 10, 2014. For this alternative model, a poisson distribution is assumed for the outcome because it is a weekly count bounded by zero. In general, these alternative models support our decision to utilize the simpler Model 2 to estimate the underlying time series that structures the extrapolated counterfactual trend. In addition to R output for the estimated poisson regression, analogous figures are offered to demonstrate the near equivalence of Model 2 and its poisson regression alternative.

Some Methodological Conclusions

- Because of the shorter time series for the BPD arrest data, in comparison to the BPD crime data, the coefficient for the time counter is based on a comparatively short interval of time. We do not, therefore, have as much confidence in period effect estimates for arrest patterns that are strongly shaped by extrapolation from time trends that are positive or negative. A good example is the outcome for drug distribution, which has a strongly negative pretreatment time trend, thereby generating positive and increasing post-Ferguson effects even though the raw observed values for these arrests are comparatively stable around a basic cyclical pattern. For this reason, we do not foreground results for these types of arrests when developing interpretations.
- Some model divergence is present across Models 3 and 4, unlike for our models for crime trends. These differences may reflect the shorter time series for arrests, containing fewer observations to fit coefficients for weather, hours of darkness, and school days.
- When the outcome has a correlated lag structure, Model 2 reduces but often does not eliminate the autocorrelation pattern.

2 Data

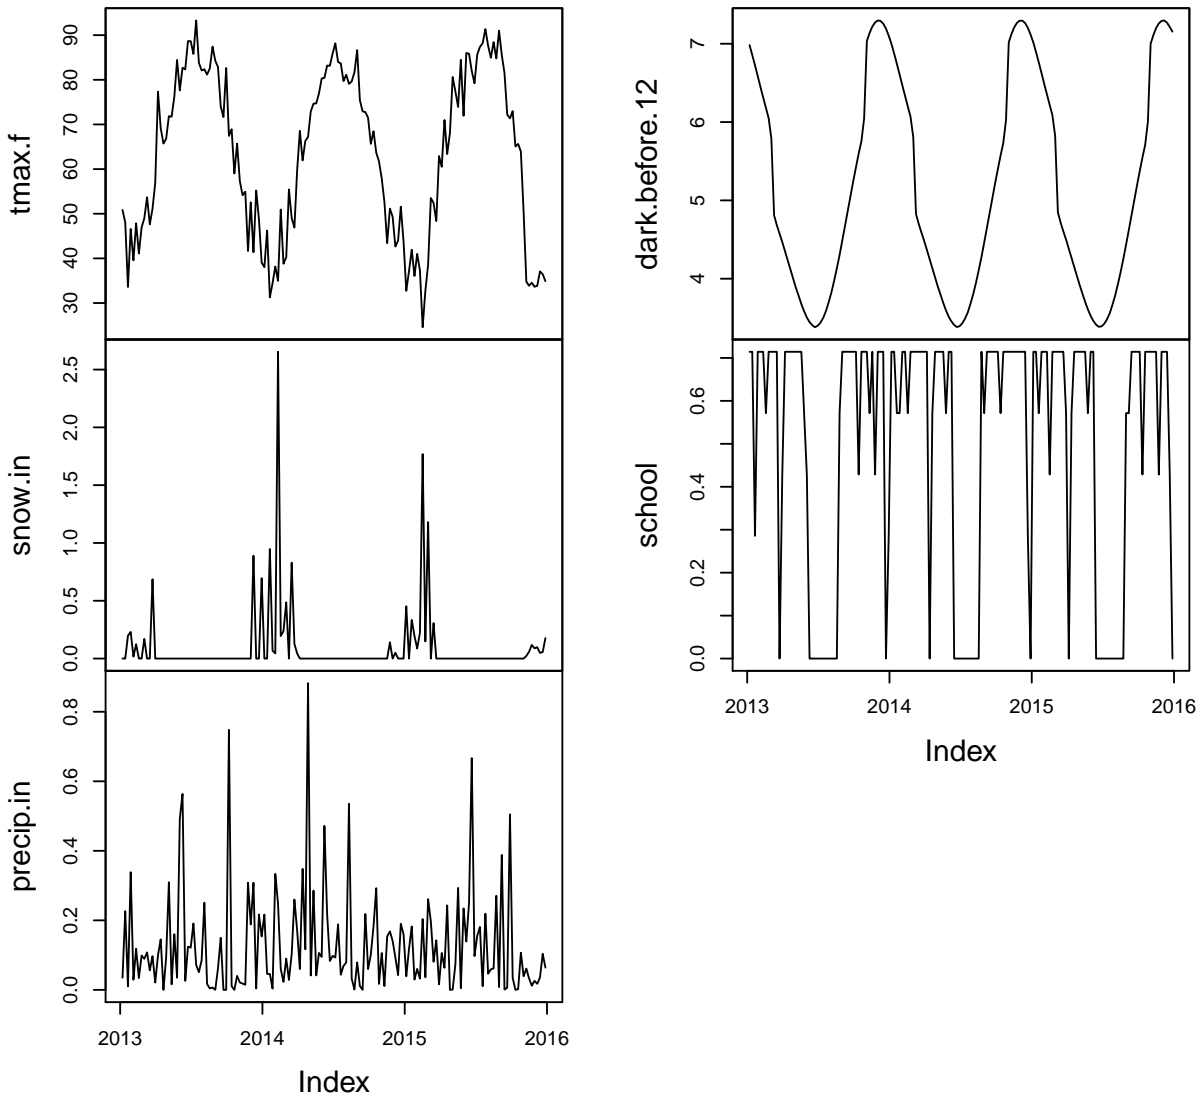

Table 2.1: Descriptive Statistics for Weekly Reported Arrests, with Breakdown by Type of Charge

Adjustment Variables for Subsequent Models

- tmax.f is the weekly average of the daily maximum temperature, measured in degrees Fahrenheit
- snow.in is the weekly average of total daily snowfall, measured in inches
- precip.in is the weekly average of total daily precipitation, measured in inches
- dark.before.12 is the weekly average of daily hours between sunset and midnight
- school is the proportion of days of the week when school was scheduled for Baltimore City Schools

(Dispersion parameter for poisson family taken to be 1)

    Null deviance: 160.99  on 82  degrees of freedom
Residual deviance: 135.35  on 72  degrees of freedom
AIC: 665.99

Number of Fisher Scoring iterations: 4

42 Results for southeastern

42.1 Summary Values for southeastern

Table 42.1: Descriptives for Outcome Before Ferguson Protests Begin

Statistic	N	Mean	St. Dev.	Min	Median	Max
southeastern	83	66.807	11.235	43	65	93

Table 42.2: Descriptives for Outcome After Ferguson Protests Begin

Statistic	N	Mean	St. Dev.	Min	Median	Max
southeastern	73	39.562	13.446	10	38	72

42.2 Four Models for southeastern

Table 42.3: Four Models that Differ on the Specification of Adjustment and Intervention Variables

	Outcome: Count Per Week			
	(1)	(2)	(3)	(4)
Time (counter in weeks)	−0.07	0.01		−0.06
After Ferguson Protests Begin (week of 8/11/14 onward)	−19.99		−24.63	−20.14
After Gray Protests Begin (week of 4/20/15 onward)	−6.99		−8.87	−8.81
Unrest and National Guard (during week of 4/27/15)	−24.17		−28.35	−25.24
After Commissioner Batts Fired (week of 7/13/15 onward)	6.44		4.84	6.29
Average Maximum Temperature to 50 Degrees		0.12		0.17
Plus Degrees in the 50s		0.48		0.32
Plus Degrees in the 60s		−1.34		−0.54
Plus Degrees in the 70s		0.61		0.33
Plus Degrees greater than 80		−0.08		−0.77
Snowfall (inches)		−4.65		−4.96
Precipitation (inches)		−18.69		−14.77
Darkness Before Midnight (hours)		−1.03		1.03
School Days (proportion of week)		−3.95		−5.15
Observations	156	83	156	156
R ²	0.59	0.15	0.61	0.64

42.3 Least Squares Model (2) for southeastern

Autocorrelation Function for the Observed Outcome for Model (2)

Autocorrelation Function for the Residuals from Model (2)

42.4 A Poisson Regression Model as an Alternative to Model (2) for southeastern

```
Call:
glm(formula = model.formula, family = poisson, data = df.windowed.pre)
```

Deviance Residuals:

Min	1Q	Median	3Q	Max
-3.0777	-1.0159	-0.1499	0.7227	3.1643

Coefficients:

	Estimate	Std. Error	z value	Pr(> z)
